

Batch response time, mix 'light', 4 workers, N = 1024, receivers in graph order (fastest last)

box = 25th-75th percentile, line = median, dot = mean, whiskers = min-max without whole-process stalls (all receivers > 5 $\times$ their median within 2 ms), $\times$ = max with them; dotted = the receiver's batch period (its deadline); batches of all repeats pooled
